

Java Practice Questions

Topics: Methods and Constructors

Instructions: Solve the questions yourself first. For output questions, predict the output before running the code.

1. METHODS — 5 Questions

1. Create a method **greet()** that prints Hello Java.

2. Create a method **add(int a, int b)** that returns the sum of two numbers. Call it with 10 and 20.

Expected Output: 30

3. Create a method **square(int n)** that returns the square of a number. Call it with 5.

Expected Output: 25

4. Create a method **isEven(int n)** that checks whether a number is even or odd. Call it with 8.

Expected Output: 8 is Even

5. What is the difference between a method with **void** return type and a method with a return value? Give one example of each.

2. CONSTRUCTORS — 5 Questions

1. Create a **Student** class with a default constructor that prints Student object created. Create an object and observe the output.

2. Create a **Student** class with name and age. Initialize them using a parameterized constructor and display them. Use Hemanth, 22.

Expected Output: Name: Hemanth

Age: 22

3. Create a **Car** class with a parameterized constructor that accepts brand and price. Display both values.

4. Create a class with two constructors: `ClassName()` and `ClassName(int x)`. Create objects using both constructors and print different messages.

5. What is a constructor? Does it have a return type? When is it executed? Write the answer in your own words.
